Ecosine high power passive harmonic filter modules

- Compact cabinet filter for quick installation and easy commissioning
- Cost-effective enclosed passive harmonic filter
- Optimized for motor drives with DC-link chokes
- Helps to comply with international power quality standards
- Supports an efficient utilization of electrical system capacity
- Filters for thyristor (SCR) rectifiers

- UL LISTED

Typical application

Schaffner ECOsine filter cabinets can be applied to virtually any kind of power electronics with front-end six thyristor rectifiers, where harmonic current distortion needs to be reduced to defined limits. The compact filter cabinets can be easily commissioned and quickly installed into existing designs without requiring an in-depth system analysis or highly trained specialists.

Typical applications include higher power AC and DC motor drives with either six thyristor used e.g. in HVAC, water/wastewater, oil & gas, or mission critical factory automation equipment. In addition, ECOsine filters can help to reduce thermal and electrical overload caused by harmonic currents in installations involving UPS, high power rectifiers and other non-linear three-phase power supplies.
Performance characteristics

**THID – Total harmonic current distortion**

ECOsine high power passive harmonic filter performance is optimized for rectifiers/motor drives with a dc-link choke. In such applications, a THID of roughly 5% can be expected. The use of a dc-link choke is highly recommended. In a system without \( L_d \), the filter module has to be derated to max. 70% of its nominal power rating. In such applications, a THID of 10…15% can be expected.

**Displacement power factor**

At full load, ECOsine filters yield unity power factor. At lower load levels, the capacitive current into the power capacitors of the trap circuit cause a leading displacement power factor. This is the case with all types of passive filters with large capacitors. However, compared to traditional filters the useful range of Schaffner ECOsine is much extended (\( \cos \phi > 0.9 \) from 35 to 100% of rated load).

ECOsine filters allow for trap disconnect at light load to avoid low DPF situations if required. This feature can be provided by the installer using a capacitor contactor of suitable size for the trap circuit.

**DC-link voltage**

ECOsine harmonic filters have a very low impact on the dc-link voltage of the motor drive. The voltage variation as function of the load is represented in the performance diagram beside. Tolerances are kept narrow in order to ensure that motor drives do not suffer from noise tripping because of under- or over-voltage conditions.

</tbody>
</table>

* Power rating for motor drives with dc-link chokes or ac line chokes, the minimum required LDC and LAC are specified in the table. If the minimum required LDC or LAC are not available, load power of the filter has to be de-rated to 70% of the specified value above in this case, the THD will be between 10-15%

Application

ECoSine\textsuperscript{®} filters are best installed directly at the input of 6 thyristor (SCR). It is possible to connect several non-linear loads (e.g. motor drives) in parallel. In this case the rating of the filter must match the sum of the power ratings of loads connected to it.
