Ecosine Compact Economy Line of Passive Harmonic Filters

- Economy line of passive harmonic filters for THID <10%
- Help to comply with EN 61000-3-12, IEEE-519 and other PQ standards
- Support an efficient utilization of electrical system capacity
- Ideal for motor drives with 6-pulse rectifier front-end
- Suitable for diode and thyristor (SCR) rectifiers applications

* System requirements: THVD <2%, line voltage unbalance <1%
* Note: performance specifications in this datasheet refer to six-pulse diode rectifiers.
* SCR rectifier front-end will produce different results, depending upon the firing angle of the thyristors.
* \( \text{Inrated} = \frac{\text{Inominal} \times \sqrt{70°C - \text{Tamb}}}{25°C} \)
* External UL-rated fuses required.

### Typical applications

- Three-phase power conversion equipment with front-end six-pulse rectifier (diode or SCR)
- Motor drives, like those used e.g. in pump and fan applications
- Battery chargers, incl. DC fast chargers for e-cars

### Typical electrical schematic

![Typical electrical schematic](image)

### Approvals

- UL US LISTED
- CE
- RoHS

### Features and benefits

FN 3416 (50 Hz) models of the ECOsine product family represent the very compact “economy line” with a THID performance of ≤10% (with Ldc). They are ideal for non-linear three-phase equipment with B6 rectifier front-end that do not require the industry-leading <5% THID performance provided by Schaffner ECOsine FN 3410/12 filters. The performance is still sufficient to comply with EN 61000-3-12 or with IEEE-519 for Isc/Il <50. Schaffner ECOsine filters help to unburden the electrical infrastructure from excess loading and heat caused by current harmonics, and therefore support a better utilization of electric system capacity. Lower harmonics also reduce the risk of system resonances and potential downtime of sensitive electronic equipment. FN 3416/18 filters upgrade standard motor drives to “low-harmonic drives” quickly and easily.
**Filter application**

ECOsine filters are best installed directly at the input of 6-pulse rectifiers. It is possible to connect several non-linear loads (e.g., motor drives) in parallel. In this case the rating of the filter must match the sum of the power ratings of drives connected to it. The use of a (built-in) DC-link choke is recommended for best harmonics mitigation performance. If the expected input power exceeds the rating of the largest available filter, and a custom solution is not desired, then two or more filters can be wired in parallel. In this mode of operation, it is recommended to use filters with equal power ratings to ensure proper current sharing.

**Typical filter performance**

Motor drive with $L_{dc}$, without harmonic filter

Motor drive with $L_{dc}$, with ECOsine FN 3416

</table>

* Filter to be selected by system voltage and load (motor drive) power. Note: the harmonic filter will reduce RMS input current. Therefore, filter selection by current rating, as it is common for EMC/EMI filters, is not recommended.

** Calculated power loss at rated load power.
